RECOMMANDATIONS

Low satisfaction and low/medium salaries are the strongest drivers of churn, so focus on improving engagement and reviewing compensation policies.

The majority of employees tend to leave between 2 and 5 years of tenure, highlighting the importance of implementing early retention initiatives.

The management department shows higher turnover risk, requiring targeted retention actions such as tailored incentives and clearer career paths.

CHURN FACTORS OBSERVATION

MOST CRUCIAL CHURN FACTOR

Global employee Sentiment

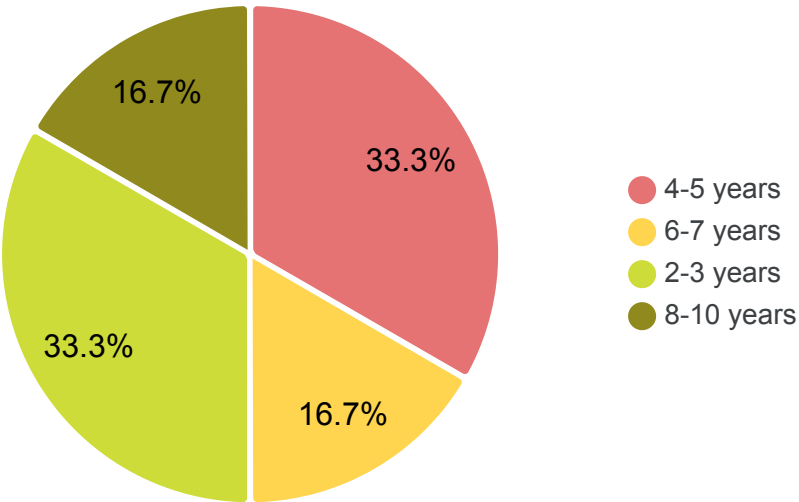

Satisfied

The model found **the most crucial factor** for predicting whether employees will stay or leave a company is **their job satisfaction**.

The longer an employee have been with the company the more likely he is to stay.

Whether or not they had a work accident does not seem to have an important impact on their decision to stay or leave.
